Jelastic is a Major Player in the Cloud Market

Forrester listed Jelastic along with AWS, Microsoft Azure and Google Cloud as a full-stack cloud platform provider that gives developers deep control over their application architectures, offers runtimes for projects written in various languages, DevOps toolchains, CaaS, database and analytics services, and many more.

Jelastic is a Major Player in the Cloud Market

IDC MarketScape Public Deployment-Centric Cloud Application Platform Market

Source: IDC, 2015

“Jelastic thrives on flexibility for partners and customers offering wide choice of programming languages, Docker containers orchestration, datacenter distribution of workloads within hybrid cloud, and automation of the main DevOps processes. Jelastic has rich container adoption and high level of DevOps automation. Partners liked Jelastic’s ease of self-provisioning and worldwide support.”

“We like that Jelastic is riding the wave of IaaS-PaaS convergence, rather than struggling against it. The company has already proven that it can support large service providers that want to build applications and services on top of its IaaS-PaaS combination.”

Eliminate Configuration Complexity

Simple, Intuitive and Functional Platform

The thing that makes me pull away from Google App Engine and Amazon Web Services is Jelastic user interface: makes life easy for me and my team whereas those other UIs are just terrible. It's too much hard work to use those platforms and in Jelastic we just know how it works. So it makes a big big difference for us.

[Paul de Villiers](#) BlueBox

*Jelastic has become the most crucial choice of solution for us. When a customer wants to host his informational system, we systematically offer him this platform. **The management interface is also to quote: simple, intuitive and functional.***

[Simon Lee](#) Atout Persona

The ease-of-use of the Jelastic control panel: it is simple and easy but extensive enough to control instances in the clear user interface, and they also offer the possibility for more advanced controls via SSH connection. When we were comparing with competitors, they offered only user interface controls or SSH terminal based controls, not both, as Jelastic does.

[Esko Kantola](#) FA Solutions

*Jelastic allowed us to host the project in a simple way with total cost control. **I do not think there is yet another alternative PaaS for Java applications like Jelastic, that is so easy to understand and use, cost-effective, and efficient for projects that do not have the continuous intensive load.***

[Paolo Urbanetto](#) Maggioli

Rich and Intuitive Web UI

The screenshot displays the Jelastic web interface. At the top, the navigation bar includes the Jelastic logo, a 'NEW ENVIRONMENT' button, and links for 'IMPORT' and 'MARKETPLACE'. On the right side of the navigation bar, there is a balance indicator showing '\$40771.84', and links for 'SETTINGS', 'HELP', and the user profile 'CLOUD@JELASTIC.COM'.

The main content area is titled 'Env Groups' and contains a table with the following columns: Name, Status, Tags, and Usage. The table lists five environment groups:

Name	Status	Tags	Usage
Magento Cluster magentocloud.jelastic.com	Running	Magento Clusters	2% 4/16
nodejscloud nodejscloud.jelastic.com	Running	Node.js cloud servers	14% 1/8
Spring Boot App springbootapp.jelastic.com	Running	Java Cloud Applications	2% 8/48
Ubuntu 16 ubuntu.jelastic.com	Running		2% 3/88
Wordpress Autoscaling wordpressscale.jelastic.cloud	Running	WordPress Clusters	2% 4/16

Below the table, there are tabs for 'Archive' and 'Git / SVN'. Under the 'Git / SVN' tab, there is an 'Add Project' section with a table listing projects and their URLs:

Name	URL
SpringBootApplication	https://github.com/jelastic/spring-boot-sample-jelastic
Alfresco	https://github.com/Alfresco/alfresco-server-root
Mangeto_2_2	https://github.com/magento/magento2
WordPress	https://github.com/WordPress/WordPress

At the bottom of the interface, there is a status bar showing 'No active tasks' and a 'Deployment Manager' button.

Jelastic is Fantastic

The slide features a blue background with the JavaOne logo in the top right corner. On the left, a small inset video shows a man speaking at a podium. The main part of the slide is a screenshot of a web browser displaying the Jelastic cloud management interface. The browser window shows a 'MAIN' tab with a resolution of '1080p / 60.00Hz'. The dashboard displays a list of cloud instances with columns for Name, Type, Usage, and Change. Below this, there is a table for 'Updates' with columns for Name, Comment, Size, and Updated date.

Name	Type	Usage	Change
Auto Provisioned CloudP...	Running	1%	13194
...	Running	22%	11096
...	Running	4%	13313
...	Running	12%	58194
...	Running	5%	13154

Name	Comment	Size	Updated date

Scaling Limits vs Real Usage

Real statistics of **defined limits** and **actually consumed resources**

Customers Feedback

We have [reduced our hosting costs by almost 30%](#). Vertical scaling has been one of our main motivations for working with Jelastic. It is undeniable that this simple system allows us today to save money and at the same time cope with peaks in one of the resources (such as during data integration and migration phases). [Simon Lee](#)

One of the core reasons we wanted to switch was mainly the cost to be honest – [we cut our hosting bill by 90%](#). We decided to move from dedicated server setup (5 or 6 servers) and reduce this down to the cloud solution Jelastic, and it has cut our hosting bill tremendously. [Robert Matthams](#)

In the previous solution, we always had to choose the exact size of the environment when setting it up, and we were charged based on the fixed size. Nowadays we just need to choose the boundary conditions, and the invoicing is based on the actual usage of resources. [Esko Kantola](#)

The possibility to get resources automatically after the increased number of requests can prevent any possible downtimes. So it's good to have automatic vertical scaling activated with no influence on the architecture and no extra charge for unused allocated resources. [Marco Kundert](#)

Reasons to choose Jelastic

- No limits to scale environments as they grow
- High availability
- Possibility to host projects across the countries of clients within the same-looking dashboard
- Easy environments set up process
- Continuous platform improvement
- Security

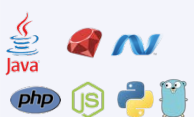

Quote

Comparing to the previous solution, we had a need to make the set-up of customer environments faster and easier: to streamline the customer implementation project. Also due to information security reasons, it is important for us to be able to host services in the same country where the service is used.
